

The Infrastructure Layer for the Next Generation of Carbon Markets.

Carbon202 is a blockchain-based infrastructure platform for the voluntary carbon market, enabling transparent issuance, tokenization, trading, and retirement of carbon credits. It integrates registries and verification systems to ensure secure, auditable, and traceable credits while eliminating double counting.

The Problem

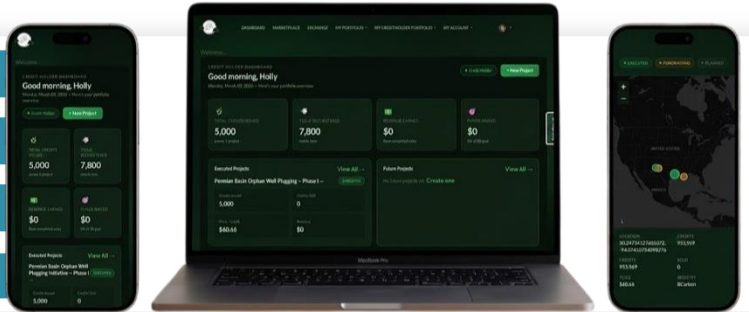

- The voluntary carbon market (~\$2-5B) is constrained by a fundamental **trust deficit**, limiting large-scale adoption
- Low transparency** across origination, verification, and retirement makes it difficult to assess credit quality
- Double-counting risk** persists due to siloed and outdated registry systems, especially across borders
- Fragmented infrastructure** with no unified platform to track the full lifecycle of carbon credits
- Lack of reliable, end-to-end tracking** reduces confidence among institutional buyers and ecosystem

Our Solutions

- Blockchain-based lifecycle tracking from issuance to retirement
- Tokenized carbon credits for secure ownership and traceability
- Independent verification layer ensuring authenticity
- Immutable on-chain retirement eliminating double counting

Our Product Offerings

- Carbon Credit Marketplace
- Tokenized Carbon Credits (NFTs)
- C2O2 Utility Token
- Carbon Credit Lifecycle Infrastructure

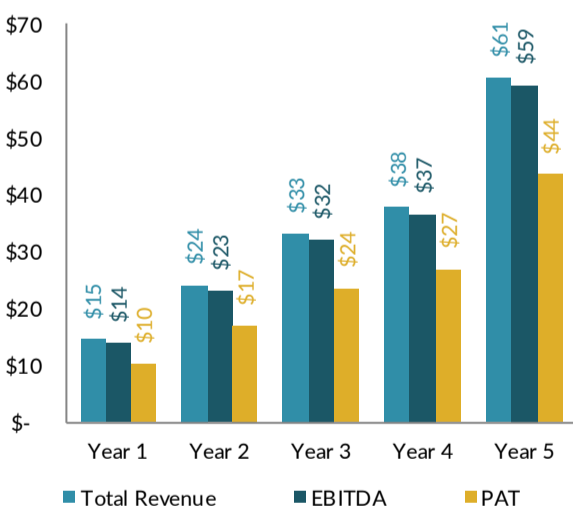

Competitive Edge

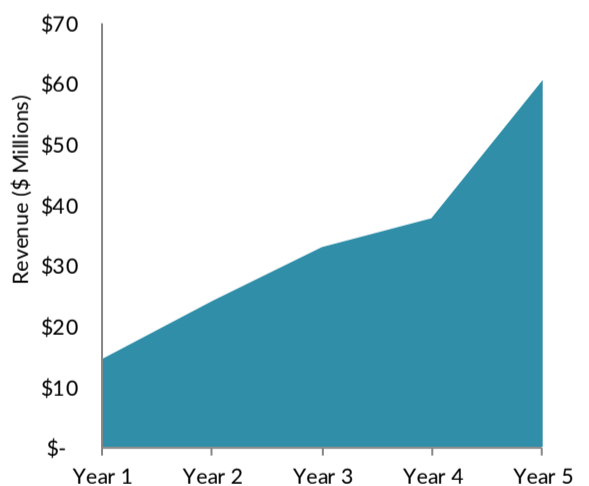

- Patent-protected dual-token architecture (ERC-20 + NFTs)
- End-to-end infrastructure (issuance → trading → retirement)
- Blockchain-based transparency with immutable audit trail
- Focus on high-integrity assets (methane & blue carbon)
- Compliance-first architecture with KYC/AML integration

Financials

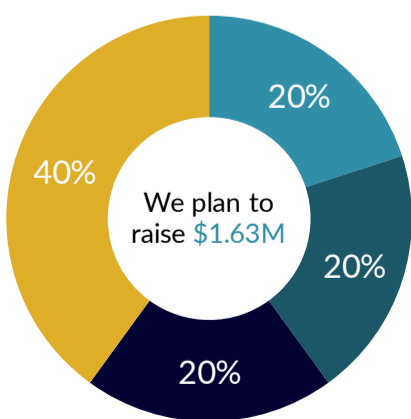

Revenue, EBITDA & PAT (\$ Millions)

Revenue Growth Trend (\$ Millions)

The Ask

- Operating Runway and Contingency
- Market Activation and Partnership
- IP Prosecution Legal and Compliance
- Platform and Marketplace Build
